

***PageSetter* Hyphenation Module**

User's Guide

INTRODUCTION

The PageSetter Hyphenation module has been included in your PageSetter LaserScript Disk. This program will process a PageSetter document and insert discretionary hyphens at all places in the text where a hyphen may occur. These discretionary hyphens are simply the "\-" codes you would normally use from within the PageSetter text editor. If a word is not hyphenated to your satisfaction you can then easily edit the "\-" codes in that word.

MAKING A BACKUP

You should always make a backup copy of your PageSetter LaserScript / Hyphenation disk for safekeeping. Be sure to read the licence agreement enclosed in this package. When making a backup copy of PageSetter LaserScript / Hyphenation Module, always write-protect your source disk.

RUNNING THE HYPHENATION MODULE

The Hyphenation module can be run from Workbench simply by double clicking on its icon. It will then open up a file requestor (similar to the one in PageSetter) prompting you for a Document file name. Alternatively you can autoload a document by clicking on the document icon and, while holding the SHIFT key down, double click on the Hyphenation icon. The program will then run and automatically load in the selected document.

After the hyphens have been inserted, the program will ask you for an output Document name. This may be the same as the input Document name, but you will then lose the original Document file. We therefore suggest that you use a different name and check the hyphenated document before deleting the original document.
